

Start here.

17a) The Company needs to consider that in order for these expansion that they are not taking over something that is more needed to the environment than what the company actually is. They also need to consider that how they are going to transport all these equipment to this different location for example; the trucks may be polluting the air more than usual, what if something falls off trucks without driver knowing & this creates litter to the area.

17b) The structural issues for this Company would be that would the Company know be able to afford the new structure that they are working in. The technical issues would be that is all the technology up to where it has to be for this Company to produce what it needs to produce. If the technology is not up to date the company will need to put money towards the upgrade of technology or buy the new machinery needed but with buying new machinery comes new P.P.E, & possibly new workers or the Company could train the old workers to use

This new machinery. The personnel issues that need to be looked at are can the company afford the relocation of the new place for example can it afford the transport of the contents of the old workplace, can the company afford to train ~~the~~ the old worker for the upgraded technology or do they ~~need~~ need to ~~hire~~ hire new workers that already know how to use the machines. The company also needs to ~~be~~ think what are the people of the community gonna say about this relocation ~~are~~ are there products going to be better or are they going to be worst standard? What will the rate of production, will it increase or decrease?
