

Question 28 (8 marks)

The flowchart shown outlines the sequence of steps used to determine the concentration of an unknown hydrochloric acid solution. 8

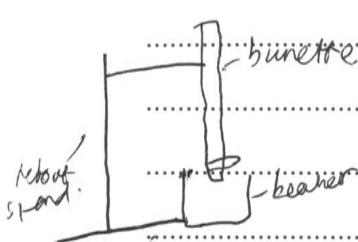

Describe steps **A**, **B** and **C** including correct techniques, equipment and appropriate calculations. Determine the concentration of the hydrochloric acid.

- (A) To prepare 0.1 M, 500mL solution of Na_2CO_3 , 0.05 moles of Na_2CO_3 are needed. $0.05 \times (2 \times 22.99 + 12.01) = 5.2995\text{g}$.
- 1) Accurately measure 5.2995 g of Na_2CO_3 using an electronic balance
- 2) Then use 50mL distilled water to dissolve it, before transferring it to a volumetric flask.
- 3) Use distilled water to make up to the mark of the solution, taking care to use a dropper to add the last few drops, ensuring the bottom of the previous one is below the bottom of the neck.

Question 28 continues on page 18

Question 28 (continued)

(B) ~~Method~~ Set up the equipment as shown.

1) Clean burette with HCl solution so be used, before filling burette to mark.

2) Use a pipette to transfer 25.0 mL of Na₂CO₃ solution to beaker.

3) Add with few drops of methyl blue indicator.

4) Using tap ^{or burette}, add few drops of acid at a time to beaker, stirring beaker constantly. As soon as solution begins to change colour record the amount of HCl used.

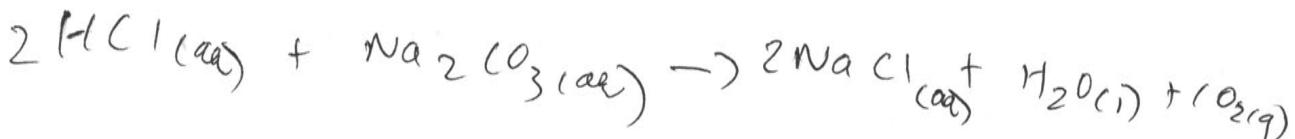

5) Empty beaker and burette and repeat steps 1 - 4

6) Record all results

7) Average results.

End of Question 28

(C) Calculations

$$\text{Diln } \text{MVR } C_a V_a = C_b V_b \times 2$$

$$C_a = \frac{2 \times 0.025 \times 0.1}{0.0214}$$

$$= 0.2336 \text{ mol L}^{-1}$$
